

Configure 2 VMs to act as Host VM and Guest VM using Oracle VirtualBox Manager in Mac

1. Configure and setup 2 Linux flavor VMs in your Oracle VirtualBox Manager. I have used Ubuntu for this.

2. Select the VM that you want to make as host. Go to Settings → Network → Adapter1 → select Bridged Adapter → select Network Connection Name → set Promiscuous Mode as “Allow VMs” → click OK.

3. Repeat the same for Guest VM also.
4. Start both the VMs and check their IPs. They might display same device interface but they will have different IPs.
5. Now, your VMs are in the Bridged mode and you can ping one from another and check the connectivity.
